

### Aim:

Write and execute a Python program to replace a character in the string.

### Input format:

- The first line of input should be a string
- The second line of input contains a character to be replaced
- The third line of input contains a new character to replace the existing character

### Output format:

- The output should be modified string

### Source Code:

`replaceChar.py`

```
# Type Content here...
n=input()
a=input()
b=input()
w=n.replace(a,b)
print(w)
```

### Execution Results - All test cases have succeeded!

Test Case - 1
User Output
